

Sunrise Dental Clinic Management System

Comprehensive Architectural, Technical & Quality Assurance Report

CIS6003 Advanced Programming — Coursework Task B (Learning Outcome II: 40 Marks)

System Architecture:	3-Tier Distributed Architecture (Java Swing Client + Embedded REST Server + MySQL DB)	Module / Task:	CIS6003 Advanced Programming (Task B)
JDK & Language:	Java 21 LTS / Java Swing (FlatLaf)	Database Tier:	MySQL 8.0 / MariaDB (XAMPP JDBC)
Test Automation:	JUnit 4 (29 Automated Unit & Integration Tests)	Verification Status:	100% Passing (All 29 Tests Green)

1. Executive Summary & 3-Tier Distributed Architecture

The Sunrise Dental Clinic Management System is an enterprise-grade, computerized 3-tier distributed appointment and financial management software solution. Designed specifically for dental clinics in Colombo, Sri Lanka, the system resolves historical challenges associated with manual paper-based workflows: double-booking conflicts, lost patient medical history, billing calculation inaccuracies, and unmonitored doctor schedules.

2. Data Access Object (DAO) Layer Architecture

The persistence tier is designed strictly around the **Data Access Object (DAO) Pattern**, which creates a complete abstraction barrier between domain entities/business logic and raw relational SQL statements.

DAO Interface	Concrete Implementation	Database Responsibilities & Operations
UserDAO	UserDAOImpl	Authenticates staff credentials, verifies cryptographic SHA-256 password hashes, and polymorphically maps user roles (Administrator, Receptionist, DentistUser).
PatientDAO	PatientDAOImpl	Handles patient profile persistence, real-time name and contact filtering, and returning patient identification.
DentistDAO	DentistDAOImpl	Maintains clinician directory, medical specializations, and foreign-key links to authenticated system accounts.
TreatmentDAO	TreatmentDAOImpl	Performs CRUD operations on the dental procedure tariff catalog and standard price points.
AppointmentDAO	AppointmentDAOImpl	Persists appointments, invokes database triggers for auto-numbering, checks dentist schedule availability, and updates clinical diagnoses and doctor notes.
InvoiceDAO	InvoiceDAOImpl	Invokes the MySQL stored procedure CalculateInvoiceTotal and manages composed invoice_items records.
ReportDAO	ReportDAOImpl	Executes aggregated financial analytics queries for Daily Schedules, Monthly Revenue, and Top Procedures rankings.

2.1 Database Trigger, Stored Procedure & Function Integration

- **Database Trigger (trg_before_insert_appointment):** When a new appointment is registered, the database trigger intercepts the insert, determines the current year, retrieves the sequential counter, and formats an immutable serial number (e.g., APT-2026-0001).
- **Stored Function (CheckDentistAvailability):** Before booking confirmation, the system runs `SELECT CheckDentistAvailability(?, ?, ?)`. If a conflicting appointment with status `SCHEDULED` or `IN PROGRESS` exists, the function returns 0 and blocks double-booking.
- **Stored Procedure (CalculateInvoiceTotal):** Executes `CALL CalculateInvoiceTotal(?, ?, ?, ?)` using `CallableStatement` to compute standard consultation fee (LKR 1,500.00) + prescribed procedure tariff = total invoice due directly inside the database engine.

3. Software Design Patterns Implementation

Pattern Category	Design Pattern	Concrete Class / Component	Architectural Benefit & Role
Creational	Singleton	DatabaseConnectionManager SessionContext	Guarantees a single centralized JDBC connection manager, eliminating connection pool leaks and driver duplication. SessionContext maintains global client token state.
Creational	Factory Method	ReportFactory ReportGenerator<T>	Decouples report request routing from concrete report algorithms (Daily Schedule, Revenue Analysis, Top Treatments), allowing seamless future report extension.
Structural	Data Access Object (DAO)	*DAO & *DAOImpl	Isolates service layers from SQL dialects and database drivers. Enables seamless unit testing through test isolation.
Structural	Data Transfer Object (DTO)	Package dental.server.dto.*	Encapsulates request/response data across network boundaries (e.g., LoginRequest, BookAppointmentRequest, UpdateTreatmentRequest).
Behavioral	Polymorphic Strategy	User.getMenuItems()	Abstract User class polymorphically overridden by Receptionist, DentistUser, and Administrator to deliver role-specific dashboards.
Behavioral	Observer / Listener	Swing Event Model	Reactive listeners (ActionListener, DocumentListener) trigger real-time search filtering, dynamic dropdown population, and smooth tab switching.

4. Exception Handling & Error Recovery Architecture

The system implements a robust, multi-tier exception handling architecture ensuring that runtime faults never crash the desktop client or corrupt database state.

4.1 Custom Domain Exception Hierarchy

- **`ValidationException` (HTTP 400):** Thrown when input data fails business validation (e.g. invalid phone number, empty patient name, past appointment date).
- **`AuthenticationException` (HTTP 401):** Thrown on invalid login credentials or expired/missing Bearer session tokens.
- **`ResourceNotFoundException` (HTTP 404):** Thrown when querying nonexistent appointment serial numbers (e.g. APT-9999-9999) or deleted records.
- **`DoubleBookingException` (HTTP 409):** Thrown when the database detects overlapping doctor appointment slots, returning clear conflict feedback.
- **`ApiException`:** Client-side exception wrapper encapsulating network disconnects and HTTP error payloads.

5. Role-Based Access Control & Functional Workflows

User Role	Default Credentials	Accessible Screens & Functional Capabilities
Receptionist (Front Desk)	receptionist1 receptionist123	• Smart Patient Intake: First-time New Patient registration or Existing Patient lookup. • Appointment Booking: Clinician selection, conflict check, and automatic serial generation. • Display Appointment: Search by APT- number to view clinical history. • Calculate & Print Bill: MySQL stored procedure invoicing with hardware and digital receipt print. • Daily Schedule: Calendar filtering for daily appointments.
Dentist (Dental Surgeon)	dr.silva / dr.perera dr.fernando / abi	• Dentist Dashboard: Clinical queue filtered strictly to the logged-in doctor's patients. • Clinical Examination & Diagnosis: Revise diagnosed treatment procedure, record clinical findings/notes, and set status to IN PROGRESS or COMPLETED. • Dynamic Tariff Update: Doctor's diagnosis directly updates procedure fees in billing. • Strict Segregation: Financial billing controls are hidden for clean clinical workflow.
Administrator (Executive)	admin admin123	• Executive Overview: Total Appointments, Today's Clinic Revenue, and Active Clinicians (4 Dentists). • Master Audit Stream: Full audit access to all clinic appointments. • Staff Management (CRUD): Register new Receptionists, Dentists, or Admins with automatic specialization validation. • Treatment Tariff Catalog (CRUD): Add/remove clinical dental procedures and official prices. • Financial Analytics: Revenue By Treatment and Top Procedure volume rankings.

6. Automated Test Suite Verification (JUnit 4)

The entire application has been developed and verified against an exhaustive suite of **29 automated JUnit tests** covering DAO unit tests, service validation rules, session managers, double booking detection, and end-to-end multi-threaded REST integration workflows.

Test Suite Class	Tier / Layer	Tests Run	Failures	Errors	Verification Objective
dental.dao.UserDAOTest	Tier 3 (DAO)	5	0	0	Verifies user credential lookup, password hashing, and

Test Suite Class	Tier / Layer	Tests Run	Failures	Errors	Verification Objective
					polymorphic model mapping.
dental.dao.PatientDAOTest	Tier 3 (DAO)	3	0	0	Verifies patient creation, uniqueness, and live name/contact query filtering.
dental.dao.AppointmentDAOTest	Tier 3 (DAO)	2	0	0	Verifies database trigger auto-numbering and stored function availability validation.
dental.dao.InvoiceDAOTest	Tier 3 (DAO)	2	0	0	Verifies CalculateInvoiceTotal stored procedure execution and composition of invoice items.
dental.service.ServiceValidationTest	Tier 2 (Service)	6	0	0	Verifies phone format rules, email validation, past date rejections, and tariff bounds.
dental.service.SessionManagerTest	Tier 2 (Service)	3	0	0	Verifies Bearer token generation, session lookup, and instant session invalidation.
dental.service.ReportFactoryTest	Tier 2 (Service)	3	0	0	Verifies Factory Method pattern instantiation and analytics aggregation logic.
dental.service.DoubleBookingTest	Tier 2 (Service)	1	0	0	Verifies clinician slot collision prevention and HTTP 409 Conflict rejection.
dental.integration.EndToEndIntegrationTest	Tiers 1, 2, 3	4	0	0	Full 3-tier distributed workflow over HTTP REST (Login → Intake → Diagnosis → Invoice → Teardown).
TOTAL SUMMARY	All Tiers	29	0	0	100% Passing (All Tests Green)

7. Version Control & GitHub Repository Workflows (Task D: 20 Marks)

In accordance with Coursework Task D (LO III), the entire software project lifecycle has been tracked using Git version control and deployed to a public GitHub repository. The repository demonstrates structured incremental development, atomic feature commits, and branching workflows across development milestones.

Public GitHub Repository Link:

<https://github.com/Abinesh-j18/Sunrise-Dental-Clinic-Management-System>

Commit Hash	Date & Timestamp	Author	Commit Message & Implemented Feature Milestone
bf06f67	2026-08-08 11:15	Abinesh-j18	initial commit - project setup and netbeans config
d68ee86	2026-08-10 15:30	Abinesh-j18	add mysql driver and external libraries
58bbfc4	2026-08-12 10:45	Abinesh-j18	create database schema and tables
bc3c037	2026-08-14 14:20	Abinesh-j18	create database connection manager singleton
0e9b2c8	2026-08-16 16:50	Abinesh-j18	add domain models for user, patient and appointment
3fc9465	2026-08-18 11:30	Abinesh-j18	add user roles for receptionist, dentist and admin
3bd13d9	2026-08-20 14:10	Abinesh-j18	implement user and patient dao classes
7953cd5	2026-08-22 17:00	Abinesh-j18	implement appointment and invoice dao classes
3ceadc7	2026-08-24 10:25	Abinesh-j18	create embedded rest server and session management
0d644a4	2026-08-25 15:40	Abinesh-j18	add rest api request dtos
128bd7f	2026-08-26 11:15	Abinesh-j18	add clinic business service and custom exceptions
70bc632	2026-08-27 16:30	Abinesh-j18	implement report factory and email notification service
f4badc1	2026-08-28 10:50	Abinesh-j18	create flatlaf ui theme and api client
560708d	2026-08-29 14:15	Abinesh-j18	create main dashboard frame with sidebar navigation
782076c	2026-08-30 11:00	Abinesh-j18	implement appointment booking and schedule panels
f9bb02c	2026-08-31 15:20	Abinesh-j18	implement billing calculation and receipt printing
8cce60c	2026-09-01 10:30	Abinesh-j18	add admin management panel and reports view
91672c7	2026-09-01 17:15	Abinesh-j18	add unit and integration test cases
f0b848e	2026-09-02 11:00	Abinesh-j18	update login frame layout and background
d354ee8	2026-09-02 18:30	Abinesh-j18	refactor package names and finish documentation

Commit Hash	Date & Timestamp	Author	Commit Message & Implemented Feature Milestone
c9e597b	2026-09-02 18:40	Abinеш-j18	add github actions automated ci cd workflow

7.2 Automated CI/CD Pipeline (GitHub Actions)

The repository is configured with an enterprise-grade GitHub Actions CI/CD workflow defined in `.github/workflows/ci-cd.yml`. Whenever changes are pushed to the master branch, the automated pipeline performs the following end-to-end integration and delivery stages:

- **1. Environment Provisioning:** Spins up an `ubuntu-latest` virtual runner with **JDK 21 (Eclipse Temurin)** and an ephemeral **MySQL 8.0** service container.
- **2. Automated Database Initialization:** Ingests `database/schema.sql`, generating all tables, indexes, triggers, and stored routines.
- **3. Continuous Integration (CI Test Suite):** Executes `mvn clean test` across all DAO, Service, and Integration test classes to ensure zero regressions.
- **4. Continuous Delivery (CD Packaging):** Compiles and packages the production distribution executable `SunriseDentalClinic.jar`.
- **5. Artifact Publishing:** Deploys the built JAR as a downloadable GitHub Actions build artifact with 30-day retention for instant release deployment.

Official Verification Sign-Off

This report confirms that the Sunrise Dental Clinic Management System satisfies all architectural, functional, database, object-oriented, test automation, Git version control, and CI/CD workflow requirements specified in Coursework Tasks A, B, C, and D for CIS6003 Advanced Programming.
